1.0 - The Need to improve Port Information

1.1 General – Purpose of Document
An improvement of port information normally requires an investment decision. Such a decision needs to be supported by arguments justifying a return on investment or improvement in performance. As every port is different, the business case per port will be different.

The subjects described in this section apply to some degree to every port suggest potential areas of investment in port development in order to increase both efficiency and safety.

1.2 Setting the scene
In 2018 the last implementation phase of the International Maritime Organization (IMO) Regulation 19, Chapter V was completed, resulting in Electronic Navigational Charts (ENC’s) in use on board of most commercial SOLAS vessels. Although the systems used to navigate SOLAS vessels have progressed enormously in the last 20 years and navigational practice has developed and adopted digital methods, the data content within an ENC is fundamentally the same as within a paper chart. This still leaves mariners with large information gaps which have been present for many years during port entry or exit.

In the same timeframe the pressure to conform to environmental regulations has increased with the IMO adopting a strategy to reduce by at least 50% the greenhouse gas (GHG) emissions from the global shipping sector by 2050.

1.3 Ports as a node in the supply chain
A port is a crucial node in the supply chain. Commercially, a port should be able to connect to the supply chain of the customer to create end to end visibility of the movement of goods and the supporting infrastructure requirements. This includes data connectivity with ships and their shoreside related offices (e.g. fleet operations centre and trading floors). Commercially well over 1.500 ports operate a network with interfaces to hinterland inter-model transportation such as barges, trains and road transportation networks. To achieve this delivery of real time data which meets both nautical and supply chain standards is essential. Data containing vessel positions is now widely and publicly available in realtime, however information about the vessels current and future activities are obscured and do not adhere to any global standards. Communication between the ship and the port is however frequently a closed system, which can be improved.
1.4 Port efficiency
As ports try and become more efficient the easiest route to expansion is to utilise currents assets better, either in the form of allowing bigger vessels, or allowing vessels to arrive with a deeper draught, or to allow a more efficient exchange of ships at the berth. Utilising human resources in a better fashion by automation of e.g. vessel – berth compatibility checks or better data management is another way of making the port more efficient.

1.5 Most sustainable port
Enabling “Just in Time” arrivals (https://bit.ly/2Ku5Biv) is key to the development of efficient shipping and cultivates sustainability by enabling more accurate steaming. On top of this it improves the planning of connected hinterland modalities like trains, barges and trucks.

1.6 Safest port
Most accidents happen in the approaches, anchorages or harbour basins of ports, as this is by far the busiest time for the mariner and vessel. The upfront exchange of nautical port information, routing, passage plans and weather information is an important risk mitigation strategy. Improvement and rationalisation of port information will free up the mariner for more essential tasks during the defined period. The upfront exchange of nautical port information, port passage plans and weather information is an important risk mitigating measure.

1.7 Legal position
Together with the legal departments of hydrographic offices, the risk of displaying data, versus the risk of not displaying data but being forced to do so after an incident, has been determined. Based on their experience it was concluded that sharing data shows due diligence and makes the legal position of the port much stronger if an accident has happened.

Currently, when chartered vessels are involved in an incident, the clauses in the charter party can have severe consequences for the reputation of the port. In most charter parties there is a “safe port, safe berth, always afloat clause”. Meaning that a charterer may send a vessel only to a safe port and to a berth that is safe and where it can always lie afloat. In other words, the Charterer has to warrant to the Owner the safety of the place to which he or she intends to send the ship.
Based on a series of court judgements all over the world a widely accepted legal definition of a(n) (un)safe port is the following:

“A port will not be safe unless, in the relevant period of time, the particular ship can reach it, use it and return from it without, in the absence of some abnormal occurrence, being exposed to danger which cannot be avoided by good navigation and seamanship.”
The key element in this definition (and case law) is that the set-up of a port, its structure, should be okay. As to what could be regarded as an abnormal occurrence, something similar applies. Just as an example: a severe NW gale might not be an abnormal occurrence, even if such a gale would occur, on average, less than in say each two years, because such a gale is a part of the local weather system. However, a hurricane might not and may be regarded as abnormal.

The foregoing means that a charterer at the moment that he or she selects a vessel for the intended voyage(s) (i.e. prior to the conclusion of a charter party) should obtain information on the following:

- Depths and dimensions
- Specific conditions that may be relevant for the intended call
- Availability of nautical services
- Availability of information when the vessel is entering port

It has to be underlined that the above four requirements are, also according to case law, part of the general ‘safe port’ requirement. Following an incident, if a court rules that required information was not available, the port might be declared as “unsafe”, which has a big impact on the reputation of the port and its business. Because of the safe port/berth warranty that a charterer has to give to the ship owner under a charter party, a charterer must select a load port / terminal and discharge port / terminal for the intended voyage(s) which are able to comply with these requirements.
2.0 The need for a Step by step approach

2.1 General
How and where to start with digitization of port data might seem difficult. This publication recommends a step by step approach, doing the basics first and taking simple steps.

2.2 Focus on vessel movements
A port is a node in the supply chain. As most cargo is transhipped to other places, many modes of transportation come together in ports. Currently, the planning of most hinterland modal facilities depend on the planning of deep sea vessel movements, therefore it makes sense to focus first on this aspect of port operations.

2.3 Focus on geographical extent
The scope of port data for the deep sea vessel is restricted to operations between the Pilot Boarding Place and the fender line of the Berth. Prior to the Plot Boarding Place this data is normally the domain of the national hydrographic office, and beyond the fender line of the Berth this data is normally the domain of the Terminal.

2.4 Focus on data content
Based on a “compliance first” approach, the scope of the data considered in this publication is based on BIMCO contract clauses (e.g. safe port, safe berth) and IMO resolutions (e.g. berth to berth passage planning):
   1. General port data
   2. When is the berth position safe
   3. When is the port passage safe
   4. When is the berth position available
   5. When is the port passage available

2.4 Scope re. data development
Each of the following geographic areas are defined in the following sections of this guide. Following the definitions of the areas (and their components) the data content for each of them is defined:
   1. Identify areas: port, terminal and berth
   2. Identify way points: pilot boarding place and berth position
   3. Identify sections: from pilot boarding place to berth position
   4. Data field definitions for port, terminal and berth
   5. Data field definitions for pilot boarding place and berth position
   6. Data field definitions for individual sections
The hierarchical relationship between geographic areas is illustrated in the following diagram:

![Diagram](attachment:image.png)

*Figure 1: The Hierarchy of areas from Port to Berth*

The hierarchical relationship between sections and waypoints is illustrated in the following diagram:

![Diagram](attachment:image.png)

*Figure 2: The Hierarchy of sections from Pilot boarding place to Berth position*
3.0 Identify Areas

3.1 Introduction

Areas represent a single point to indicate to which area the ship is going. A vessel receives many locations during its port entry/exit. In order of granularity the most important locations for the vessel’s port passage plan are:

1. Port
2. Terminal

3.2 Port

<table>
<thead>
<tr>
<th>Name:</th>
<th>Port</th>
<th>Source::</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Any port, terminal, offshore terminal, ship and repair yard or roadstead which is normally used for the loading, unloading, repair and anchoring of ships, or any other place at which a ship can call. The word “port” also embraces geographically, a city or borough which serves shipping interests. Other national standards and frameworks may describe such administrative entities already.</td>
<td>NP100 IHO S-32</td>
</tr>
</tbody>
</table>

| Location | A single position which represents the port as a whole. Generally a centre of gravity position is chosen to represent the port’s location. This is aligned with the airline industry. |

<table>
<thead>
<tr>
<th>Indirect reference</th>
<th>Direct reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>UN/LOCODE</td>
<td>Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West)</td>
</tr>
<tr>
<td>E.g.: NLRTM for Port of Rotterdam</td>
<td>E.g.: 51.9166666, 4.5000000 = 51 degrees, 55 minutes North, 004 degrees, 30 minutes East for Port of Rotterdam</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute(s)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Name of the port, e.g.: Port of Rotterdam</td>
<td></td>

</tr>
<tr>
<td>E.g.: 51.954662, 4.031931 for 51 degrees, 57 minutes North, 004 degrees, 2 minutes East for APMT</td>
</tr>
</tbody>
</table>

#### Attribute(s)

| 1. Name of the terminal and/or GiSIS number, SMDG or BIC numbers, e.g.: APMT2 |
| 2. General terminal data (not specified here, free text and responsibility of terminal) |
3.4 Berth

<table>
<thead>
<tr>
<th>Name:</th>
<th>Berth</th>
<th>Source:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>The space assigned to or taken up by a vessel when anchored or when lying alongside a wharf, jetty, or other structure</td>
<td>NP100</td>
</tr>
</tbody>
</table>

**Location**

Quay walls, berth or jetty: The berth’s extent is between its two extremities as shown in the diagram below, measured in a straight line, indicated by A and B. Every point should be named and/or numbered. Orientation is not important. Letters are normally used over numbers.

Mooring buoy: The berth extent is between the extremities of the mooring buoy positions

**Indirect reference**

Global Location Number (GLN) (ISO/IEC 6523)  
E.g.: 8719331013789 for APMT terminal in Rotterdam Maasvlakte 2

**Direct reference**

Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West)  
E.g.: for APMT2 in Rotterdam:  
A: 51.95100, 3.99855  
B: 51.95816, 4.00733

**Attribute(s)**

Name of berth  
E.g.: APMT2

![Diagram of Berth Types](image)
4.0 Identify Waypoints

4.1 Introduction

This section defines important waypoints which provide individual locations to indicate the positions to which the ship is navigating. Normally the ship receives the following locations in order of granularity:

1. The Pilot Boarding Place
2. The Berth Position

The positions defined above, together with additional waypoints are compiled into a port passage plan, a line which connects the various port sections through which the vessel is navigating.

4.2 Pilot Boarding Place

<table>
<thead>
<tr>
<th>Name:</th>
<th>Pilot Boarding Place</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>At sea, the meeting place to which the pilot comes out</td>
<td>IHO S-57 IHO S-4</td>

</tbody>
</table>
### 4.3 Berth Position

<table>
<thead>
<tr>
<th>Name:</th>
<th>Definition</th>
<th>Source:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Berth Position</td>
<td>The position along the line of a berth, specified by one point (e.g. bollard, manifold or ramp number), allowing the vessel to berth in the correct position along the berth.</td>
<td>IHO S-32</td>
</tr>
</tbody>
</table>

| Location | A single position which represents the Berth Position |

<table>
<thead>
<tr>
<th>Indirect reference</th>
<th>Direct reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Location Number of Berth (ISO/IEC 6523) with extension (for bollard/manifold/ramp number)</td>
<td>Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West)</td>
</tr>
<tr>
<td>E.g.: 8719331013789-25 for APMT2 berth bollard 25</td>
<td>E.g.: 51.887190, 4.284030</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute(s)</th>
<th>1. Name of berth and bollard number</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2. E.g. APMT2 bollard 25</td>
</tr>
</tbody>
</table>

**2. BERTH POSITION**

![Berth Types Diagram](image)
5.0 Identify Sections

5.1 Introduction

Port sections are bodies of water through which the ship is navigating from pilot boarding place to berth. Each body of water has its restrictions, e.g. maximum sizes, conditions or regulations.

Normally the ship navigates in the following sections, in order of granularity:

1. Fairway
2. Turning basin
3. Basin
4. Berth pocket

5.2 Fairway

<table>
<thead>
<tr>
<th>Name</th>
<th>Fairway</th>
<th>Source:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Fairway: Sometimes called Ship Channel. The main navigable channel in the approaches either with the sea, with an outer port or with another basin.</td>
<td>NP100</td>
</tr>
<tr>
<td>Location</td>
<td>A body of water E.g. xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx</td>
<td></td>
</tr>
<tr>
<td>Indirect reference</td>
<td>Direct reference</td>
<td></td>
</tr>
<tr>
<td>Global Location Number (GLN) (ISO/IEC 6523)</td>
<td>Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West) E.g.: 51.9200000, 4.5000000 for Nieuwe Maas</td>
<td></td>
</tr>
</tbody>
</table>
| Attribute(s)          | 1. Additional Identifiers  
  2. Name of the fairway                  |         |
### 5.3 Turning Basin

<table>
<thead>
<tr>
<th>Name</th>
<th>Turning Basin</th>
<th>Source: NP100</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Turning basin: An area of water or enlargement of a channel in a port, where vessels are enabled to turn, and which is kept clear of obstructions such as buoys for that purpose</td>
<td></td>
</tr>
<tr>
<td>Location</td>
<td>A body of water <a href="#">E.g. xxxxxxxxxxxxxxxxxxxxxxxxxx</a></td>
<td></td>
</tr>
<tr>
<td>Indirect reference</td>
<td>Direct reference</td>
<td></td>
</tr>
<tr>
<td>Global Location Number (GLN) (ISO/IEC 6523)</td>
<td>Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West) E.g.: 51.9200000, 4.5000000 for Waalhaven</td>
<td></td>
</tr>
</tbody>
</table>
| **Attribute(s)** | 1. Additional Identifiers  
2. Name of the Turning Basin |               |
### 5.4 Basin

<table>
<thead>
<tr>
<th>Name</th>
<th>Basin</th>
<th>Source:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Basin: A sheltered body of water available for port operations connecting either with the sea, with an outer port or with another basin</td>
<td>IHO S-32</td>
</tr>
</tbody>
</table>

| Location      | A body of water [E.g. xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx](#)               |

<table>
<thead>
<tr>
<th>Indirect reference</th>
<th>Direct reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Location Number (GLN) (ISO/IEC 6523)</td>
<td>Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West) E.g.: 51.92000000, 4.5000000 for Waalhaven</td>
</tr>
</tbody>
</table>

| Attribute(s) | 1) Additional Identifiers  
  2) Name of the Basin |

### 5.5 Berth pocket

<table>
<thead>
<tr>
<th>Name</th>
<th>Berth Pocket</th>
<th>Source: NP100</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Berth pocket: Body of water at the berth or anchor berth with sufficient footprint to allow the vessel to make fast to the shore or mooring buoys or to anchor.</td>
<td></td>
</tr>
<tr>
<td>Location</td>
<td>A body of water</td>
<td></td>
</tr>
<tr>
<td>Indirect reference</td>
<td>Direct reference</td>
<td></td>
</tr>
<tr>
<td>Global Location Number (GLN) (ISO/IEC 6523)</td>
<td>Datum: WGS 84. Held in decimal degrees to a defined precision, (minus to indicate South and West) E.g.: 51.9200000, 4.5000000 for Berth 5</td>
<td></td>
</tr>
<tr>
<td>Attribute(s)</td>
<td>1) Additional Identifiers 2) Name of Berth Pocket</td>
<td></td>
</tr>
</tbody>
</table>
6.0 Attributes for Areas

This section defines a number of data fields for each individual area.

6.1 Attributes for Ports

General Port Information

General information about the port

General information

General, introductory information about the port. This should be confined to information not contained in any other definitions

Format:
- Free text

Developments

Details of any active development affecting traffic in the port. Long term development plans should not be covered here but reference can be made to a section on the port website

Format:
- Free text

Limits description

Description of the area covered by the information specified

Format:
- Free text

General information

General, introductory information about the port. This should be confined to information not contained in any other definitions

Format:
- Free text

Developments

Details of any active development affecting traffic in the port. Long term development plans should not be covered here but reference can be made to a section on the port website

Format:
- Free text
**Limits description**

Description of the area covered by the information specified

Format:
- Free text

**ISPS security level**

Format:
- IPS Security Level: Level 1,2 or 3
- Qualifying Remarks: free text

**Load Line Zone**

The load line zone in which the port is located. Defined by the IMO’s International Convention on Load Lines

Format:
- Free text according to the IMO Load line convention with respect to the seasonal zones: Summer Winter, Tropical, Winter North Atlantic, Fresh, Tropical Fresh

**Maximum vessel sizes**

Any size constraints on vessels using the port as a whole. It is not intended to capture constraints that may exist within an individual berth or port section – these should be captured in the appropriate section

Format:
- Maximum length: in decimal metres
- Maximum beam: in decimal metres
- Maximum air draught: in decimal metres
- Supplementary information: free text

**Time Zone**

Time zone in which the port is located

Format:
- Standard Time: UTC +/- xx hrs
- Daylight Saving Time: UTC +/- xx hrs
- DST Start: date
- DST End: date

**Local holidays**

Dates and names of any local or national holidays that may affect the working of the port
Format:
- Name: free text
- Start Date: date
- End Date: date

Working hours
Working days and hours for the Port Authority, i.e. the times when they are contactable. It does not define the specific working times of various port services or terminals: these should be recorded as individual services
Format:
- Start Day: date
- End Date: date
- Week Day Start: free text
- Week Day End: free text

Cargo
Types of cargo handled by the port
Format:
- Cargo Type: free text
- Weight of Goods: weight of goods or number of containers per calendar year in tonnes
- Supplementary Information: free text

Charts
Charts and publications that can be used to navigate the port approaches and port basins and waterways
Format (per chart or publication):
- Chart Number: free text
- Title: free text
- Identifier: free text
- Publisher: free text

Shipping announcements
Local shipping announcements relevant to port users
Format:
- Free text

Legal disclaimer
Any additional legal disclaimers that a port wish to make
Contact Information

This section defines the content of contact details.

Contact details will generally be supplied for:

- All people and service providers who are the recipients or reports under the “reports and documentation” section
- The emergency coordination centre
- The service provides referenced under “nautical services” and “vessel services”

General contact information

Introductory text or high level, nonspecific information for contacting people in the port. This does not contain specific name, address or other contact details for any individual or service (these are defined as individual “point of contact”)

Format:

- Free text

Point of contact

Detailed contact information for an official point of contact within the port

Format:

- Individual Name: free text
- Department name: free text
- Role: free text
- Hours of Service: free text
- Contact Instructions: free text
- Voice Number: free text
- Fax Number: free text
- VHF Channel: free text
- E-mail: free text
- Delivery Point: free text
- City: free text
- Administrative Area: free text
- Postal Code: free text
- Country: free text
**Inter ship communication**

Specification of a communication channel for vessels in the port or a port section

Format:
- VHF Usage: fee text
- VHF Channel: free text
- Remarks: free text

**Weather and Tidal Information**

Weather and tide information for the port

**Real time weather and tidal information**

Links to any official real-time weather or tidal information provided by the port

Format:
- Free text or reference to a port website

**Local weather and tidal phenomena**

Details of any important local weather or tidal conditions within the port

Format:
- Phenomena: free text
- Details: free text
- Location: free text

**Reports & Documentation**

Defines the various reports (e.g. notification, declarations, reports) and documentation that a visiting vessel will be expected to send to the port either before arrival, during its stay in port or before and after departure. Port’s reports will be in fixed formats and will require completion. Documentation are standardized documents which need to be presented to the port authorities. The exact requirements will vary per port

**Pre arrival Reports**

Detailed requirements for each report that needs to be sent to the port before arrival

Format:
- Report Category: free text
- Who: fee text
- What: free text
- To: free text
- How: free text
- When: free text
- Remarks: fee text
**In port Reports**

Detailed requirements for each report that needs to be sent to the port whilst in port

Format:
- Report Category: free text
- Who: free text
- What: free text
- To: free text
- How: free text
- When: free text
- Remarks: fee text

**Pre departure Reports**

Detailed requirements for each report that needs to be sent to the port prior to departure

Format:
- Report Category: free text
- Who: fee text
- What: free text
- To: free text
- How: free text
- When: free text
- Remarks: fee text

**Documentation requirements**

Details of any documentation that vessels will be required to provided to authorities in port

Format:
- Vessel Type: free text
- Document: free text

**Regulations and Exemptions**

Details of any relevant local regulations that apply in the port such as bunkering procedures use of linesmen or Pilot Exemption certificate (PEC). This does not include national or international regulations which may be documented elsewhere.

**Regulation**

Details of any local regulations that apply in the port or its surrounding water

Format:
- Free text or reference to a port website
Exemptions
Any exemptions that may apply to classes of vessel or suitably qualified people
Format:
- Free text or reference to a port website

Port Safety
Identification of equipment, procedures and points of contact that should be used in case of an emergency within the port

Emergency coordination centre
The Emergency Coordination Centre information for the port. Individuals should be entered as a “Point of Contact” and referenced within this information
Format:
- Free text

Emergency response equipment
Types, locations and availability of emergency response equipment
Format:
- Equipment Type: free text
- Equipment Availability: free text

Emergency procedures
Relevant emergency response procedures
Format:
- Category of Emergency: free text
- Emergency Procedure: fee text

Services
This section defines the individual services that are available in the port

Nautical services
Services related to the safe passage and berthing of the vessel: VTS, Pilotage, Towage/Tugs, Lines
Format:
- Nautical Service Type: free text
- Service Name: free text
- Service Location Description: free text
- Service Area Description: free text
- Service Hours: free text
• Working Hours: free text
• Service Details: free text

**Vessel services**

Services related to the vessel and her cargo: Bunkers, Lube Oil, Potable Water, Provisions, Stores, Waste per IMO class, Repairs, Lashing, Cargo Survey, Draught Survey, Vetting

Format:

• Vessel Nautical Service Type: free text
• Service Name: free text
• Service Location Description: free text
• Service Area Description: free text
• Service Hours: free text
• Working Hours: free text
• Service Details: free text
• Working Hours: free text
  ➢ Start Day: free text
  ➢ End Day: free text
  ➢ Week Day Start: free text
  ➢ Week Day End: free text

**6.2 Attributes for Terminals**

**General Terminal Information**

General information about the terminal – this is normally the domain of the terminal. Especially oil and LNG terminals might have specified terminal information templates, as per OCIMF or SIGTTO.

**6.3 Attributes for Berths**

**General Berth Information**

See Attributes for Terminals
7.0 Attributes for Waypoints
The most important information is at what time the vessel arrives at or departs from a waypoint.

7.1 Attributes for Arrival times

Estimated Time of Arrival (ETA)
When a vessel estimates it will arrive at specified location.
Format: yyyy-mm-ddThh:mm:ssZ [ISO 8601]

Requested Time of Arrival (RTA)
When a vessel is requested to arrive at a specified location.
Format: yyyy-mm-ddThh:mm:ssZ

Planned Time of Arrival (PTA)
When a vessel plans to arrive at a specified location.
Format: yyyy-mm-ddThh:mm:ssZ

Actual Time of Arrival (ATA)
When a vessel arrives at a specified location.
Format: yyyy-mm-ddThh:mm:ssZ

7.2 Attributes for Departure times

Estimated Time of Departure (ETD)
When a vessel estimates it departs from a specified location.
Format: yyyy-mm-ddThh:mm:ssZ

Requested Time of Departure (RTD)
When a vessel is requested to depart from a specified location.
Format: yyyy-mm-ddThh:mm:ssZ

Planned Time of Departure (PTD)
When a vessel plans to depart from a specified location.
Format: yyyy-mm-ddThh:mm:ssZ
Actual Time of Departure (ATD)

When a vessel departs from a specified location.
Format: yyyy-mm-ddThh:mm:ssZ
8.0 Attributes for Sections

The most important information is the maximum size restriction of a vessel for a particular section, both horizontally and vertically.

8.1 Attributes for Horizontal restrictions

Maximum length
Maximum permitted length overall (LOA)
Format: decimal metres

Minimum Parallel Mid-Body alongside
The minimum PMB requirement for the berth during time alongside, including both arriving and departing the berth
Format: decimal metres

Maximum beam
Maximum permitted beam
Format: decimal metres

Maximum Arrival Displacement
The maximum displacement of the vessel on arrival at the berth
Format: Tonnes (1000 kg) or Tons (2240lb)

Maximum Displacement Alongside
The maximum displacement of the vessel whilst alongside the berth
Format: Tonnes (1000 kg) or Tons (2240lb)

8.2 Attributes for Vertical restrictions

Maximum draught
Maximum depth of the keel below the water line at any point along the hull
Format: decimal metres to a defined water density measured in kg/m³

Maximum air draught
Maximum permitted air draught
Format: decimal metres
Maximum draught (including air draught) is the most discussed value within shipping. It should be provided together with the following data elements to ensure all actors have the same understanding of the safety margins:

**Maintained depth**
The Depth at which a channel is kept by human influence, usually by dredging
Format: decimal metres with reference to a specific Sounding Datum

**Sounding**
Measured or charted depth of water or the measurement of such a depth
Format: decimal metres with reference to a specific Sounding Datum

**Overdredge**
An additional depth margin provided by a dredging operation to ensure that the depth at a specific location is never less than the pre-determined maintained depth over the interval between programmed dredging operations
Format: decimal metres

**Height of tide**
The vertical distance between the chart datum to the level of the water at a particular time
Format: decimal metres with reference to a specific Sounding Datum

**Observed depth**
The vertical distance from the sea surface to the sea floor, at any state of the tide
Format: decimal metres

**Minimum Water Density**
The minimum water density value within a particular area. Density is equivalent to specific gravity and represents the ratio. At atmospheric pressure, of the weight of a given volume of sea water to that of an equal volume of distilled water at 4 degrees Celsius
Format: kg/m³

**Fresh Water Allowance (FWA)**
The change in draught of a vessel due to the difference between salt and fresh water
Format: decimal metres

**Under Keel Clearance (UKC)**
The distance between the lowest point of the ship's hull, normally some point on the keel, and the sea bottom.
Format: a defined value in decimal metres or a percentage of draught and/or beam
**Under Keel Clearance policy**

A restriction imposed by an authority on a vessel to ensure the depth below the keel meets an acceptable (usually minimum) single or range of values  
Format: decimal metres or a percentage of draught and/or beam

**Nature of Bottom**

The feature of the bottom including the material of which it is composed and its physical characteristics.  
Fixed textual values according to International Chart 1, BA Chart 5011, IHO S-32 and IHO S-57  
Format: Fixed format text according to e.g. IHO S-4 / IHO S-57 E.g. Sand, Mud, Clay, Silt, Stones, Gravel, Pebbles, Cobbles, Rock, Boulder, Coral
Appendix 1 – Determining Standards for port information

Standards within ports

For official declarations, notifications and to facilitate international trade, ports use existing global standards (FAL documents, WCO standards, UNCEFACT). However for real time day to day operations ports generally use national or local standards, and a migration to common, globally defined standards requires both investment and culture change.

Therefore, together with the wider marine industry stakeholders, including ports, shipping, their agents, standardization bodies (www.portcalloptimization.org) only robust, global, cross industry standards within the shipping industry and beyond (e.g. World Meteorological Office, International Standardization Organization) have been selected, ensuring a sustainable investment of money and hours. That content was then cross checked with numerous international bodies including The International Harbour Master Association (IHMA), International Association of Marine Aids to Navigation and Lighthouse Authorities (IALA), United Kingdom Hydrographic Office (UKHO), International Hydrographic Organization (IHO), BIMCO, Oil Companies International Marine Forum (OCIMF), GS1, International Standardization Organization (ISO).

Because ports act as a node in the supply chain, and their customers need more and more end to end visibility, connectivity to supply chain standards is important. Therefore GS1 has been adopted in this publication as the most global and robust standardization body spanning the broader supply chain.

Similarly, as ports are part of a global network for commercial vessels, standardized terms from the nautical domain have been used for master and event data descriptions. IHO and UKHO publications have been referred to as the most global and robust standardization body for nautical standards.

Long term maintenance of standards is as critical as the selection of the individual standards themselves, and, having learnt from other industries that robust maintenance from the outset by a robust organization saves time and money, ISO standards have been selected as a framework where possible. Maintenance of some standards might be delegated to related organizations such as GS1 or UNCEFACT.

Realizing that the common interpretation of the information by different actors is crucial, the focus of development was first on the functional definitions to ensure adoption of common semantics. For real time data exchange the overall requirement is for interoperability, so a data format has been proposed, based on existing supply chain standards. Interfaces are possible, although the number of interfaces is ideally limited.
Direct or indirect references?
This publication makes the distinction between locations determined directly and indirectly. Indirect references have the advantage over direct references as they do not change after updates of infrastructure or ownership. Generally, direct references, positions referenced to a particular datum are used in navigational charts and other publications.

Standards for Indirect location references
Many indirect references for ports exist. UN/LOCODE is an existing ISO standard (ISO 3166), and is used today in many documents like Bill of Lading. It is not perfect and is undergoing a process of revision currently, but is the best combination of global footprint and level of detail available to the stakeholder community.

For indirect references of port areas, waypoints and port sections the Global Location Number (GLN)) is an existing ISO standard (ISO/IEC 6523), which has global governance and is used today billion times on a daily basis in the supply chain industry. It is the only guaranteed globally secure, unique number and can be used in combination with local identification numbers. GLNs are purchased through a national GS1 office, which is available in every country. Can be assigned by the port authority so the number does not change after change of ownership of the berth (like the IMO number of the vessel).

Other identifiers within port areas also exist and have been evaluated. Inland ECDIS ISRS number has not been selected as they are specific to inland waters only. GISIS numbers have not been used as they are specific to the terminal only, and only for terminals with ISPS. Similarly UN/LOCODEs with SMDG extension have not been used, as they only apply to the terminal, and are specific to container or roro terminals. These codes are only unique if used together with the UN/LOCODE, and change after change of ownership. UN/LOCODE with a BIC extension have not been used, as it maintains a database for container terminals only. Future standards such as the MRN number do not yet have the sufficient global governance. Future interfaces between MRN and GLN are possible which preserves uniqueness through interoperable standards.

Standards for Direct location references
Direct references are almost always defined as positions in relation to some kind of defined global, local or regional datum. Decimal degrees is preferred with a negative value signifying (by convention) a hemisphere of South and West. There is a distinction between the storage of direct location references and their representation in digital systems. Use of the representation format for display avoids any ambiguity and, although not as user friendly as traditional display formats such as degrees, minutes and seconds, can mitigate any risks of conversion. IHO standards for positioning within electronic charts use decimal degrees (although navigation systems such as ECDIS may have different display formats for positions). IHO S-57 and IHO S-100 both use a fixed level of precision (usually 7 decimal places) for direct position references in charts.
It is left to the data producer to establish an appropriate number of decimal places for positional representation and to establish and publish appropriate information concerning positional accuracy. IHO S-57, S-4 and S-32 define terms associated with these concepts and accepted custom and practice in this area. Other standards bodies such as ISO have similar mechanisms for representing positions and use decimal numbers to represent coordinates within a fixed coordinate reference system (CRS). The ISO19100 provides a comprehensive framework for the representation of all geospatial data and is the common ancestor of the IHO standards.

Datums

Positions should always be referenced with respect to a defined horizontal and vertical geodetic datum as part of a defined Coordinate Reference System (CRS). For horizontal datums WGS 84 is preferred and is the mandated standard for positions within electronic navigational charts, replacing the variety of datums used in global paper charts prior to the standardisation of navigational materials. A large series of datums is defined within the global geospatial community, the most notable of which is the EPSG codes defined by the International Association of Oil and Gas Producers. ISO19111 (Geographic Referencing by spatial coordinates) uses EPSG codes. WGS84 is represented as EPSG:4326 and many legacy CRSs can (and should) be transformed to WGS84 for harmonised portrayal and planning. Future adoption of the International Terrestrial Reference Frame (ITRF which differs from WGS84 by only a few centimetres) within the IHO community may be proposed in the future as the basis of a global reference frame.

Vertical datum

Similarly to Horizontal Datums, standardisation of Vertical datums for direct location references are important and used for specification of both heights (elevation) and depths. Used on navigational charts the choice of vertical datum is referred to as Chart Datum. These are largely based on tidal datums such as Lowest Astronomical tide or Low Water. IHO defines many terms relating to tidal height and tidal reference surfaces and makes recommendations as to best practice for vertical datum standards to be followed by marine stakeholders. While the exact choice of vertical datum used for locations is made by the data producer the IHO specifies best practice for elevations as a High Water datum and a Low Water datum for depths. The exact choice is a local one, however, due to seasonal and hydrological considerations. In areas of negligible tidal variation Mean Sea Level (MSL) is generally used as a vertical datum.

Times

Representations of times are derived from IMO FAL, BIMCO Statement Of Facts (SOF) forms, Logbooks, and clauses of charter parties. The format “Year-month-day-hours-minutes-second Zulu” is from ISO standard (ISO 8601), already widely used in the supply chain industry. Various time dependent definition sources are listed below:
1. **ETA**: Aligned with the IMO FAL definition, enhanced by adding the “specified location” for more accuracy. This is calculated based on current speed to next waypoint and planned speed for the remaining route including speed limitations and other known parameters, such as wind, current, waves.

2. **RTA**: Currently used within ports with “Just In Time” procedures to maximise protection of anchorages and to optimise lock planning. This is now being implemented in contract clauses to enable Just In Time arrivals. The requested time is received on ship from either port (for Pilot Boarding Place) or terminal (for Berth).

3. **PTA**: Is used today in some Electronic Display Information Systems (ECDIS) and is often the arrival time agreed in contract, according to a timetable or based on a time received from port. Normally shared by ship in route plan. Planned Time of Arrival (PTA) does not change, as propulsion is subsequently adjusted to meet this time, based on Speed To Maintain (STM). The STM is calculated based on a defined Distance To Go (DTG) and hours to go to the Planned Time of Arrival and is expressed as a Speed Over Ground (SOG).

4. **ATA**: In current use in the maritime industry. The time stamp is set when a waypoint is reached.

5. **ETD**: Aligned with the IMO FAL definition, enhanced by adding the “specified location” for more accuracy. ETD is calculated based on current speed to next waypoint, planned speed on the remaining route including speed limitations and other known parameters. The estimate can also be based on calculation of the estimated time of completion of cargo or vessel services (e.g. bunkers) or other non-navigational matters.

6. **RTD**: Also used today in ports with “Just In Time” procedures. Now being implemented in clauses of contracts to enable Just In Time arrivals. The requested time is received on ship usually from ports.

7. **PTD**: Used today in some Electronic Display Information Systems (ECDIS). Often the departure time agreed in contract, according to a fixed timetable or based on time received from port.

8. **ATD**: Used today in the maritime industry. A time stamp is defined after departing from a specified location.

### Formats for exchange of event data

**EPCIS.**

EPCIS is encapsulated in an existing ISO standard (ISO/IEC 19987:2017) and is a global GS1 standard which has been used for over a decade in global supply chains for representation of events. Events may be recorded for any location and any object or entity. EPCSI uses non-significant ID keys where available insulating against future changes to attributes. Ports may use any EPCIS element as needed, with no obligation to use irrelevant elements. EPCIS has a rich pre-existing vocabulary with extensions possible for mode, sector or trade specifics.

### Publication and promotion of standards

These standards will be promoted via this publication and via a tight alignment with the glossary of NP100, The UKHO’s Mariners Handbook. This publication is most frequently available on the bridge of all SOLAS (UN / IMO Safety Of Life At Sea Convention) vessels and in all global port offices.
